on pain-related quality of life. There is, however, no evidence identifying if the alfa or beta form is superior or the optimal dose or frequency of ERT. It is always difficult to study rare diseases, given the limited population available to study and given that many of these disorders, such as AFD, are long-term, chronic illnesses and long follow up is required. With regards to safety, adverse events

## ING DELLA TERAPIA ENZIMATICA SOSTITUTIVA NEL PAZIENTE NEFROPATICO

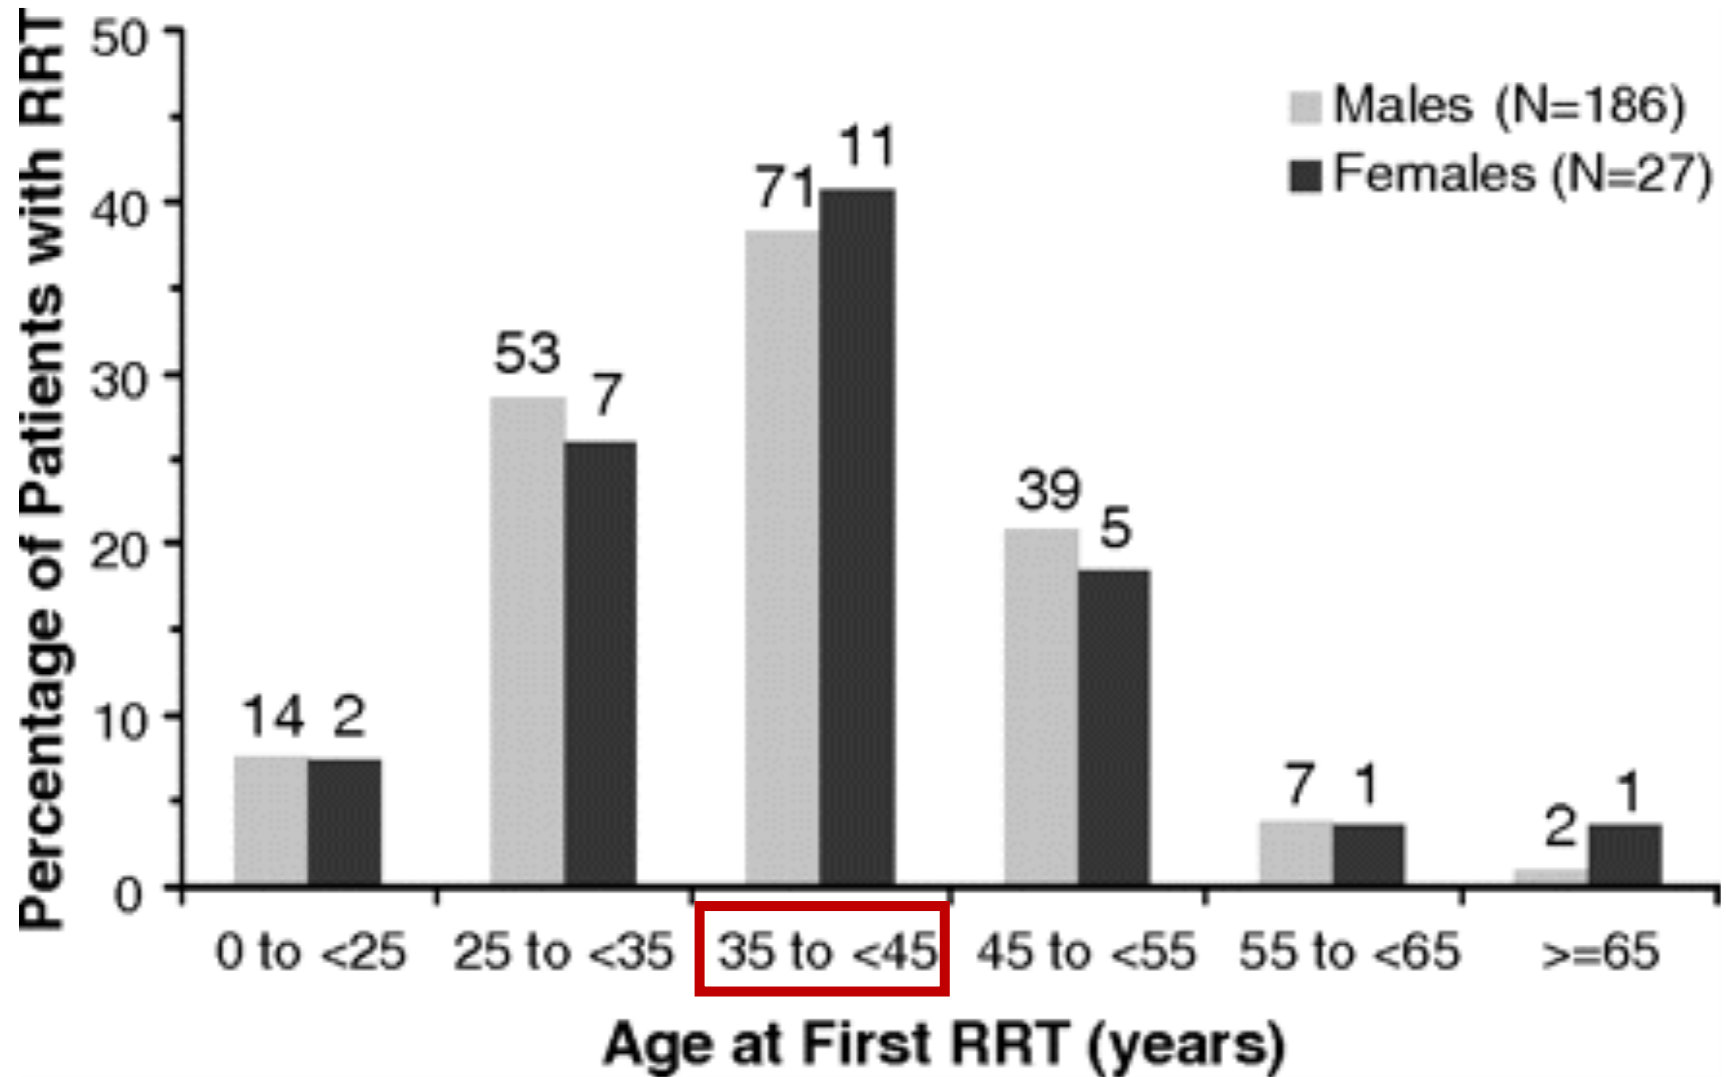

iniziare agalsidasi  $\alpha$  alla dose standard di 0.2 mg/kg ogni 2 settimane o agalsidasi  $\beta$  alla dose standard di 1 mg/kg ogni 2 settimane  
una fatta diagnosi clinica o istologica di nefropatia in entrambi i sessi

nonostante non ci siano al momento evidenze robuste di efficacia, nel paziente con proteinuria  $>1$  g/die o con insufficienza renale  
ca o in dialisi/trapianto, si può considerare l'introduzione o il mantenimento della terapia enzimatica sostitutiva alle dosi standard  
agliate per la prevenzione del danno d'organo cardiaco o cerebro-vascolare

Chronic kidney disease: indications for screening and guidance for diagnosis and treatment by the European Renal Best Practice

- 4.3 In a patient on haemodialysis, and when ERT is deemed indicated, we recommend administering the ERT during a haemodialysis session. (1A)
- 4.4 We recommend kidney transplantation as a valuable option in patients who are eligible for this intervention. (Ungraded statement)
- 4.5 After renal transplantation, we do not suggest ERT for renal indications, but it can be continued for non-renal indications. (Ungraded statement)

## Age at first renal replacement therapy

# Criteria to stop or not start ERT

| Criteria   | Class of recommendation        |
|--|--------------------------------|
| Compliance > 50% of infusions  | Class I                        |
| Failure to attend regularly (according to local guidelines) at FU visits   | Class I                        |
| Experiencing life threatening or severe infusion reactions that do not respond to prophylaxis, e.g. anaphylaxis            | Class I                        |
| Request for ERT  | Class I                        |
| Advanced renal disease, without an option for renal transplantation, in combination with advanced heart failure (class IV) | Class IIA                      |
| Advanced FD or other comorbidities with a life expectancy of < 1 year  | Class IIB                      |
| Cognitive decline of any cause   | Class IIB                      |
| No response for 1 year when the sole indication for ERT is neuropathic pain while receiving maximum symptomatic care*      | Class IIB                      |
| <b>Criteria for not starting ERT</b>   | <b>Class of recommendation</b> |
| Advanced cardiac disease with extensive fibrosis [37] if cardiac disease is the sole treatment indication <sup>†</sup>     | Class I                        |
| Advanced renal disease, without an option for renal transplantation, in combination with advanced heart failure (class IV) | Class IIA                      |
| Advanced FD or other comorbidities with a life expectancy of < 1 year  | Class IIB                      |
| Cognitive decline of any cause   | Class IIB                      |

# Screening, diagnosis, and management of patients with Fabry disease: conclusions from a “Kidney Disease: Improving Global Outcomes” (KDIGO) Controversies Conference

# Limits

*o scientific evidence as to the optimal age of ERT initiation.*

*o uniform guidelines, and conditions and age to start ERT differ in various countries.*

*o development of signs or symptoms related to FD is an indication to start E*

*o the benefits of early treatment, before irreversible tissue injury occurs,*

*o should be balanced against the burden of biweekly infusions in very young*

*o individuals.*

*o lack of agreement on cessation criteria.*

# Knowledge gaps and research recommendations

Determine when to start treatment in asymptomatic or pauci-symptomatic patients, females, with non-classic disease

Obtain expanded information on the natural history of FD in classic female patients and non-classic FD patients, and the effects of ERT in these groups

Establish criteria and biomarkers for dose individualization

# nefropatia in corso di malattia di Anderson-Fabry: nuove raccomandazioni sulla diagnosi, il follow up e la terapia

## **ANDO UNA FORMULAZIONE DI AGALSIDASI PUÒ ESSERE CONVERTITA CON L'ALTRA**

Assenza di intolleranza ad una delle due formulazioni nonostante un'adeguata premedicazione e la riduzione della velocità di infusione del farmaco

Assenza di reazione allergica ad una delle due formulazioni considerando la possibilità di una cross-reazione e praticando comunque un'adeguata premedicazione

Assenza di una ripresa della sintomatologia soggettiva non renale, in particolare di dolore neuropatico

# Take Home Messages

**Guidelines are very useful in summarizing current knowledge on Fabry disease therapy**

**There are differences in recommendations of therapy initiation**

**Study comparing both ERT formulations are still underpowered**

**There are a variety of research questions on Fabry disease**
